

Domain-Specific Languages by OpenResty Inc.

Implementation Strategies & Technologies

Yichun Zhang
Creator of OpenResty and Founder of OpenResty Inc.

Who am I?

- ▶ Yichun Zhang
- ▶ Creator of the open source OpenResty project.
- ▶ CEO and cofounder of OpenResty Inc.
- ▶ Former founding team member of Cloudflare.
- ▶ Former technical expert at Taobao, Alibaba.
- ▶ Former Senior Engineer at Yahoo!.

- ▶ A very efficient interpreter and a very fast tracing-based JIT compiler.
- ▶ Very small memory footprint.
- ▶ Extremely lightweight coroutines which can be used to do transparent IO multiplexing and nonblocking IO.
- ▶ Great C interoperability via FFI and the standard VM C API.
- ▶ Explicit bytecode representation which helps separating the compiling and the execution phases (like to different machines and environments).
- ▶ Easy to hack (small code base and fast VM build time).
- ▶ Great portability to many different architectures and operating systems.
- ▶ An efficient incremental mark-and-sweep garbage collector.
- ▶ Great for a common language runtime for different dynamic languages.

Why Lua and LuaJIT?

- ▶ Communicate intentions and knowledge more efficiently with machines.
- ▶ Domain experts can use their own languages.
- ▶ Machines have more freedom in implementations and optimizations.
- ▶ Better error handling & constraint enforcement.

Why DSLs

Real-World DSLs

- ▶ Regular Expressions
- ▶ BNF
- ▶ Maple & Mathematica's user languages
- ▶ SQL
- ▶ XPath
- ▶ CSS (CSS selectors)

Internal DSLs

```
package Point;
use Moose; # automatically turns on strict and warnings

has 'x' => (is => 'rw', isa => 'Int');
has 'y' => (is => 'rw', isa => 'Int');

sub clear {
    my $self = shift;
    $self->x(0);
    $self->y(0);
}

package Point3D;
use Moose;

extends 'Point';

has 'z' => (is => 'rw', isa => 'Int');

after 'clear' => sub {
    my $self = shift;
    $self->z(0);
};
```

- ▶ Parsec for Haskell
- ▶ Lpeg for Lua
- ▶ Moose for Perl

Limitations of Internal DSLs

- ▶ Error reporting is a challenge (line numbers)
- ▶ Syntax must be compatible with the host language
- ▶ Restricted by the host language compiler & runtime
- ▶ Limited by the host language's user base

```
mirror_mod = modifier_ob.  
set mirror object to mirror.  
mirror_mod.mirror_object =  
operation == "MIRROR_X":  
mirror_mod.use_x = True  
mirror_mod.use_y = False  
mirror_mod.use_z = False  
operation == "MIRROR_Y":  
mirror_mod.use_x = False  
mirror_mod.use_y = True  
mirror_mod.use_z = False  
operation == "MIRROR_Z":  
mirror_mod.use_x = False  
mirror_mod.use_y = False  
mirror_mod.use_z = True  
  
selection at the end -add  
mirror_ob.select= 1  
modifier_ob.select=1  
context.scene.objects.active  
("Selected" + str(modifier_ob.  
mirror_ob.select = 0  
= bpy.context.selected_object  
data.objects[one.name].select  
  
print("please select exactly  
  
-- OPERATOR CLASSES ----  
  
types.Operator):  
on X mirror to the selected  
object.mirror_mirror_x"  
mirror X"  
  
context):  
context.active_object is not
```

Challenges in Implementing DSLs

Parsers

```
graph TD; A[Parsers] --> B[Intermediate Representations (IRs), ASTs]; B --> C[Context-Sensitive Analysis (Semantic Analysis & Optimizers)]; C --> D[Code Generation];
```

Intermediate Representations (IRs), ASTs

Context-Sensitive Analysis (Semantic Analysis & Optimizers)

Code Generation

Lua for DSLs

- ▶ Used as the source language
- ▶ Used in compilers
- ▶ Used as the target language

- ▶ ORJS is still in an early phase of development and does not do any deep optimizations yet.
- ▶ For a non-recursive Fibonacci sample, ORJS is **30%** faster than V8.
- ▶ ORJS takes **70%** less memory than V8 for a non-recursive Fibonacci JavaScript example (d8 is used for comparison).
- ▶ ORJS takes **80%** less memory than NodeJS using the same example.
- ▶ The ORJS runtime includes the full OpenResty's nginx binary with a lot of Nginx modules compiled in.

ORJS: A JavaScript compiler targeting LuaJIT/OpenResty

- ▶ Perl-compatible regular expressions (PCRE)
- ▶ Expression-level `do ... end` blocks
- ▶ `goto label`
- ▶ `table.new(narr, nrec)`
- ▶ `table.clone(tb)`
- ▶ `table.nkeys(tb)`
- ▶ `table.isarray(tb)`
- ▶ `table.isempty(tb)`

Enhancements to LuaJIT & OpenResty

Why Powerful Regular Expressions

- ▶ Look-ahead

```
/ (?! (?: continue | break | for ) \b ) ([_A-Za-z]\w*) /  
/ \|\| (?! = ) /  
/ \s* (?= \} | ; ) /
```

- ▶ Recursion

```
/ -- (?: \[ (=*) \[ .*? \] \2 \] \s* | [^\n]* \n? ) /
```

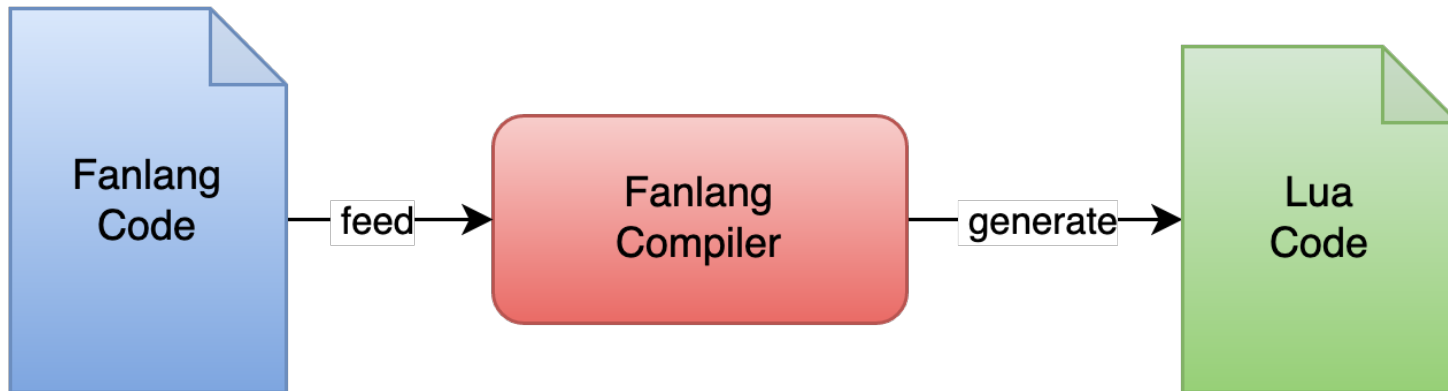

Composable Lua Code (for codegen)

```
1  local a = (function ()
2      local e = foo(
3          (function ()
4              local b = bar()
5              if b > 3 then
6                  return b
7              end
8              return b - 1
9          end)(),
10         (function ()
11             local res = 0
12             for i = 1, 3 do
13                 res = res + i
14             end
15             return res
16         end)()
17     ) -- foo()
18     return e * e
19 end)()
```

```
1  local a = do
2      local e = foo(
3          do
4              local b = bar()
5              if b > 3 then
6                  return b
7              end
8              return b - 1
9          end,
10         do
11             local res = 0
12             for i = 1, 3 do
13                 res = res + i
14             end
15             return res
16         end
17     ) -- foo()
18     return e * e
19 end -- do
```

- ▶ Fanlang (by OpenResty Inc.), a Perl 6 dialect

DSLs for
Implementing
DSLs

A simple arithmetic calculator in Fanlang

```
1 grammar calc {
2   expr:
3     - term(s add-op) -
4
5   add-op:
6     / \s* ( [+ - ] ) \s* /
7
8   term: factor(s mul-op)
9
10  mul-op:
11    / \s* ( [ * \ / ] ) \s* /
12
13  factor: atom(s '^')
14
15  atom:
16    | number
17    | '(' expr ')'
18
19  number:
20    / ( -? \d+ (?: \. \d+ )? ) /
21 }
22
23 class Calc {
24   has $.x;
25   has $.y;
26 }
```

- ▶ Grammar rules and Perl-compatible regular expressions are part of the language itself.

Top-down & Bottom-up Analysis in ASTs

```
1 self.look-down: [  
2   'YLang::AddrExpr' => sub ($_, $fld, $parent, $idx) {  
3     my $op = .operand;  
4     if $op.isa: 'YLang::DerefExpr' {  
5       my $new-node = $op.operand;  
6       replace-node $new-node, $fld, $parent, $idx;  
7       return True, $new-node;  
8     }  
9  
10    True; # continue  
11  },  
12  
13  'YLang::DerefExpr' => sub ($_, $fld, $parent, $idx) {  
14    my $op = .operand;  
15    if $op.isa: 'YLang::AddrExpr' {  
16      my $new-node = $op.operand;  
17      replace-node $new-node, $fld, $parent, $idx;  
18      return True, $new-node;  
19    }  
20  
21    True; # continue  
22  },  
23  
24  ...  
25 ];
```

Edgelang

- ▶ <https://doc.openresty.com/en/edge/edgelang/>

```
uri("/foo"), uri-arg("n") < 1, user-agent() contains "Chrome" =>  
  exit(403);
```

Opslang

<https://doc.openresty.com/en/plus/opslang/>

```
$ rpmbuild --rebuild "$.file",
stream {
    out suffix /Enter pass phrase: \s*\z/ =>
    send-key("\n"),
    redo;

    found-prompt =>
    break;
},
```
